If the deployed app is not working, these are the steps to run on localhost:

1) Clone the GitHub repo into the desired location (recommend creating a new directory):
   https://github.com/ryankang2/leaze/

   git clone https://github.com/ryankang2/leaze.git
   cd leaze

2) Download MAMP (not MAMP PRO)
   https://www.mamp.info/en/

   Open Mamp, and click Preferences. These should be the Ports settings:

   In the Web server settings, select the document root to be the **public** subfolder within the **leaze** folder:

3) Open your terminal and go to the location you saved the project (you should be in the leaze directory):

    npm install webpack
    git checkout -b dev
    git pull origin dev
    npm run start

4) The web app is now running locally at:

    http://localhost:3000
